

Measurements of five further specimens examined :—Two males, wing 75–77 ; three females, wing 67–71 mm.

This new bird is named in honour of the collector, Mr. C. W. Benson, who has made some very remarkable discoveries in Nyasaland.

Mr. R. E. MOREAU sent the following description of a new *Artisornis* :—

***Artisornis winifredæ*, sp. nov.**

*Description.*—Whole of the upper parts olive-green, except the forehead and crown which are intermixed with rufous-brown. Below chin whitish, the throat, ear-coverts, side of face and chest pale rufous-brown, not being quite so deep in colour as the crown of the head ; remainder of under parts pale olive-green which is lighter in tone than the upper parts and has a yellowish tinge.

*Soft Parts.*—Upper mandible black, lower whitish horn, dark at tip, feet brown-black.

*Distribution.*—Uluguru Mts., Morogoro District, Tanganyika Territory.

*Type.*—In the British Museum, male, Kinole Forest, north Uluguru, Tanganyika Territory, collected by R. E. Moreau on July 11, 1937. Collector's no. 4170. Brit. Mus. Reg. no. 1938.6.18.1.

*Measurements of Type.*—Wing 54 ; tail 51 ; culmen from base 17 ; tarsus 23 mm.

*Remarks.*—It is possible that the specimen is not fully adult, and the fact that the rufous-brown feathers of the head are intermixed with those of olive-green, and that some of the feathers on the belly are faintly barred, rather points to this.

For the present this bird has been placed in the genus *Artisornis*, but it is doubtful whether this is correct. It agrees with *Artisornis* in the shape of the wing and bill, but has a shorter tarsus and longer tail in proportion to the length of the wing.

This new bird is named in honour of my wife.
